

Features

- 8-bit Microcontroller Compatible with 8051 Products
- Enhanced 8051 Architecture
 - Single Clock Cycle per Byte Fetch
 - 12 Clock per Machine Cycle Compatibility Mode
 - Up to 20 MIPS Throughput at 20 MHz Clock Frequency
 - Fully Static Operation: 0 Hz to 20 MHz
 - On-chip 2-cycle Hardware Multiplier
 - 16x16 Multiply–Accumulate Unit
 - 256 x 8 Internal RAM
 - On-chip 2KB Expanded RAM (ERAM)
 - Software Selectable Size (0, 256, 512, 768, 1024, 1792, 2048 Bytes)
 - Dual Data Pointers
 - 4-level Interrupt Priority
- Nonvolatile Program and Data Memory
 - 64KB of In-System Programmable (ISP) Flash Program Memory
 - 4KB of EEPROM (AT89LP51ED2/ID2 Only)
 - 512-byte User Signature Array
 - Endurance: 10,000 Write/Erase Cycles
 - Serial Interface for Program Downloading
 - 2KB Boot ROM Contains Low Level Flash Programming Routines and a Default Serial Bootloader
- Peripheral Features
 - Three 16-bit Enhanced Timer/Counters
 - Seven 8-bit PWM Outputs
 - 16-bit Programmable Counter Array
 - High Speed Output, Compare/Capture
 - Pulse Width Modulation, Watchdog Timer Capabilities
 - Enhanced UART with Automatic Address Recognition and Framing Error Detection
 - Enhanced Master/Slave SPI with Double-buffered Send/Receive
 - Two Wire Interface 400K bit/s
 - Programmable Watchdog Timer with Software Reset
 - 8 General-purpose Interrupt and Keyboard Interface Pins
- Special Microcontroller Features
 - Dual Oscillator Support: Crystal, 32 kHz Crystal, 8 MHz Internal (AT89LP51ID2)
 - Two-wire On-Chip Debug Interface
 - Brown-out Detection and Power-on Reset with Power-off Flag
 - Selectable Polarity External Reset Pin
 - Low Power Idle and Power-down Modes
 - Interrupt Recovery from Power-down Mode
 - 8-bit Clock Prescaler
- I/O and Packages
 - Up to 40 Programmable I/O Lines
 - Green (Pb/Halide-free) PLCC44, VQFP44, QFN44, PDIP40
 - Configurable I/O Modes
 - Quasi-bidirectional (80C51 Style), Input-only (Tristate)
 - Push-pull CMOS Output, Open-drain
- Operating Conditions
 - 2.4V to 5.5V V_{CC} Voltage Range
 - -40° C to 85° C Temperature Range
 - 0 to 20 MHz @ 2.4V–5.5V (Single-cycle)

8-bit Flash Microcontroller with 64KB Program Memory

AT89LP51RD2/ED2/ID2 Summary - Preliminary

1.5 Pin Description

Table 1-1. Atmel AT89LP51RD2/ED2/ID2 Pin Description

Pin Number			Symbol	Type	Description
VQFP VQFN	PLCC	(1) PDIP			
1	7	6	P1.5	I/O I/O I/O I/O	P1.5: User-configurable I/O Port 1 bit 5. MISO: SPI master-in/slave-out. When configured as master, this pin is an input. When configured as slave, this pin is an output. MOSI: SPI master-out/slave-in (Remap mode). When configured as master, this pin is an output. When configured as slave, this pin is an input. During In-System Programming, this pin is an input. CEX2: Capture/Compare external I/O for PCA module 2.
2	8	7	P1.6	I/O I/O I/O	P1.6: User-configurable I/O Port 1 bit 6. SCK: SPI Clock. When configured as master, this pin is an output. When configured as slave, this pin is an input. MISO: SPI master-in/slave-out (Remap mode). When configured as master, this pin is an input. When configured as slave, this pin is an output. During In-System Programming, this pin is an output. CEX3: Capture/Compare external I/O for PCA module 3.
3	9	8	P1.7	I/O I/O I/O I/O	P1.7: User-configurable I/O Port 1 bit 7. MOSI: SPI master-out/slave-in. When configured as master, this pin is an output. When configured as slave, this pin is an input. SCK: SPI Clock (Remap mode). When configured as master, this pin is an output. When configured as slave, this pin is an input. During In-System Programming, this pin is an input. CEX4: Capture/Compare external I/O for PCA module 4.
4	10	9	RST	I/O I	RST: External Reset input (Reset polarity depends on POL pin). The RST pin can output a pulse when the internal Watchdog reset or POR is active. DCL: Serial Debug Clock input for On-Chip Debug Interface when OCD is enabled.
5	11	10	P3.0	I/O I	P3.0: User-configurable I/O Port 3 bit 0. RXD: Serial Port Receiver Input.
6	12		P4.1	I/O I/O	P4.1: User-configurable I/O Port 4bit 1. SDA: TWI bidirectional Serial Data line.
7	13	11	P3.1	I/O O	P3.1: User-configurable I/O Port 3 bit 1. TXD: Serial Port Transmitter Output.
8	14	12	P3.2	I/O I	P3.2: User-configurable I/O Port 3 bit 2. INT0: External Interrupt 0 Input or Timer 0 Gate Input.
9	15	13	P3.3	I/O I	P3.3: User-configurable I/O Port 3 bit 3. INT1: External Interrupt 1 Input or Timer 1 Gate Input
10	16	14	P3.4	I/O I/O	P3.4: User-configurable I/O Port 3 bit 4. T1: Timer/Counter 0 External input or output.
11	17	15	P3.5	I/O I/O	P3.5: User-configurable I/O Port 3 bit 5. T1: Timer/Counter 1 External input or output.
12	18	16	P3.6	I/O O	P3.6: User-configurable I/O Port 3 bit 6. WR: External memory interface Write Strobe (active-low).
13	19	17	P3.7	I/O O	P3.7: User-configurable I/O Port 3 bit 7. RD: External memory interface Read Strobe (active-low).
14	20	18	P4.7	I/O O	P4.7: User-configurable I/O Port 4 bit 7. XTAL2A: Output from inverting oscillator amplifier A. It may be used as a port pin if the internal RC oscillator or external clock is selected as the clock source A.
15	21	19	P4.6	I/O I	P4.6: User-configurable I/O Port 4 bit 6. XTAL1A: Input to the inverting oscillator amplifier A and internal clock generation circuits. It may be used as a port pin if the internal RC oscillator is selected as the clock source A.

Table 1-1. Atmel AT89LP51RD2/ED2/ID2 Pin Description

Pin Number			Symbol	Type	Description
VQFP VQFN	PLCC	(1) PDIP			
16	22	20	GND	I	Ground
17	23		P4.3	I/O I/O	P4.3: User-configurable I/O Port 4 bit 3. DDA: Bidirectional Debug Data line for the On-Chip Debug Interface when OCD is enabled.
18	24	21	P2.0	I/O O	P2.0: User-configurable I/O Port 2 bit 0. A8: External memory interface Address bit 8.
19	25	22	P2.1	I/O O	P2.1: User-configurable I/O Port 2 bit 1. A9: External memory interface Address bit 9.
20	26	23	P2.1	I/O O O	P2.2: User-configurable I/O Port 2 bit 2. DA- : DAC negative differential output. A10: External memory interface Address bit 10.
21	27	24	P2.3	I/O O O	P2.3: User-configurable I/O Port 2 bit 3. DA+ : DAC positive differential output. A11: External memory interface Address bit 11.
22	28	25	P2.4	I/O I O	P2.4: User-configurable I/O Port 2 bit 5. AIN0: Analog Comparator Input 0. A12: External memory interface Address bit 12.
23	29	26	P2.5	I/O I O	P2.5: User-configurable I/O Port 2 bit 5. AIN1: Analog Comparator Input 1. A13: External memory interface Address bit 13.
24	30	27	P2.6	I/O I O	P2.6: User-configurable I/O Port 2 bit 6. AIN2: Analog Comparator Input 2. A14: External memory interface Address bit 14.
25	31	28	P2.7	I/O I O	P2.7: User-configurable I/O Port 2 bit 7. AIN3: Analog Comparator Input 3. A15: External memory interface Address bit 15.
26	32	29	P4.5	I/O O	P4.5: User-configurable I/O Port 4 bit 5. PSEN: External memory interface Program Store Enable (active-low).
27	33	30	P4.4	I/O I/O	P4.4: User-configurable I/O Port 4 bit 4. ALE: External memory interface Address Latch Enable.
28	34		P4.0	I/O	P4.0: User-configurable I/O Port 4 bit 0. SCL: TWI Serial Clock line. This line is an output in master mode and an input in slave mode.
29	35	31	POL	I	POL: Reset polarity
30	36	32	P0.7	I/O I/O	P0.7: User-configurable I/O Port 0 bit 7. AD7: External memory interface Address/Data bit 7.
31	37	33	P0.6	I/O I/O I	P0.6: User-configurable I/O Port 0 bit 6. AD6: External memory interface Address/Data bit 6. ADC6: ADC analog input 6.
32	38	34	P0.5	I/O I/O I	P0.5: User-configurable I/O Port 0 bit 5. AD5: External memory interface Address/Data bit 5. ADC5: ADC analog input 5.
33	39	35	P0.4	I/O I/O I	P0.4: User-configurable I/O Port 0 bit 4. AD4: External memory interface Address/Data bit 4. ADC4: ADC analog input 4.
34	40	36	P0.3	I/O I/O I	P0.3: User-configurable I/O Port 0 bit 3. AD3: External memory interface Address/Data bit 3. ADC3: ADC analog input 3.

AT89LP51RD2/ED2/ID2 Summary - Preliminary

Table 1-1. Atmel AT89LP51RD2/ED2/ID2 Pin Description

Pin Number			Symbol	Type	Description
VQFP VQFN	PLCC	(1) PDIP			
35	41	37	P0.2	I/O I/O I	P0.2: User-configurable I/O Port 0 bit 2. AD2: External memory interface Address/Data bit 2. ADC2: ADC analog input 2.
36	42	38	P0.1	I/O I/O I	P0.1: User-configurable I/O Port 0 bit 1. AD1: External memory interface Address/Data bit 1. ADC1: ADC analog input 1.
37	43	39	P0.0	I/O I/O I	P0.0: User-configurable I/O Port 0 bit 0. AD0: External memory interface Address/Data bit 0. ADC0: ADC analog input 0.
38	44	40	VDD	I	Supply Voltage
39	1		P4.2	I/O	P4.2: User-configurable I/O Port 4bit 2. XTAL2B: Output from low-frequency inverting oscillator amplifier B (AT89LP51ID2 only). It may be used as a port pin if the internal RC oscillator or external clock is selected as the clock source.
40	2	1	P1.0	I/O I/O	P1.0: User-configurable I/O Port 1 bit 0. T2: Timer 2 External Input or Clock Output. XTAL1B: Input to the low-frequency inverting oscillator amplifier B and internal clock generation circuits. It may be used as a port pin if the internal RC oscillator is selected as the clock source.
41	3	2	P1.1	I/O I I	P1.1: User-configurable I/O Port 1 bit 1. T2EX: Timer 2 External Capture/Reload Input. SS: SPI Slave-Select.
42	4	3	P1.2	I/O	P1.2: User-configurable I/O Port 1 bit 2.
43	5	4	P1.3	I/O I/O	P1.3: User-configurable I/O Port 1 bit 3. CEX0: Capture/Compare external I/O for PCA module 0.
44	6	5	P1.4	I/O I I/O	P1.4: User-configurable I/O Port 1 bit 4. SS: SPI Slave-Select (Remap Mode). This pin is an input for In-System Programming CEX1: Capture/Compare external I/O for PCA module 1.

Note: 1. The AT89LP51ID2 is not available in the PDIP package.

2. Overview

The Atmel® AT89LP51RD2/ED2/ID2 is a low-power, high-performance CMOS 8-bit 8051 micro-controller with 64KB of In-System Programmable Flash program memory. The AT89LP51ED2 and AT89LP51ID2 provide an additional 4KB of EEPROM for nonvolatile data storage. The devices are manufactured using Atmel's high-density nonvolatile memory technology and are compatible with the industry-standard 80C51 instruction set.

The AT89LP51RD2/ED2/ID2 is built around an enhanced CPU core that can fetch a single byte from memory every clock cycle. In the classic 8051 architecture, each fetch requires 6 clock cycles, forcing instructions to execute in 12, 24 or 48 clock cycles. In the AT89LP51RD2/ED2/ID2 CPU, standard instructions need only one to four clock cycles providing six to twelve times more throughput than the standard 8051. Seventy percent of instructions need only as many clock cycles as they have bytes to execute, and most of the remaining instructions require only one additional clock. The enhanced CPU core is capable of 20 MIPS throughput whereas the classic 8051 CPU can deliver only 4 MIPS at the same current consumption. Conversely, at the same throughput as the classic 8051, the new CPU core runs at a much lower speed and thereby greatly reducing power consumption and EMI. The

AT89LP51RD2/ED2/ID2 also includes a compatibility mode that will enable classic 12 clock per machine cycle operation for true timing compatibility with the Atmel AT89C51RD2/ED2.

The AT89LP51RD2/ED2/ID2 retains all of the standard features of the AT89C51RD2/ED2, including: 64KB of In-System Programmable Flash program memory, 4KB of EEPROM (AT89LP51ED2/ID2 Only), 256 bytes of RAM, 2KB of expanded RAM, up to 40 I/O lines, three 16-bit timer/counters, a Programmable Counter Array, a programmable hardware watchdog timer, a keyboard interface, a full-duplex enhanced serial port, a serial peripheral interface (SPI), on-chip crystal oscillator, and a four-level, ten-vector interrupt system. A block diagram is shown in [Figure 2-1](#).

In addition, the Atmel® AT89LP51RD2/ED2/ID2 provides a Two-Wire Interface (TWI) for up to 400KB/s serial transfer; a 10-bit, 8-channel Analog-to-Digital Converter (ADC) with temperature sensor and digital-to-analog (DAC) mode; two analog comparators; an 8MHz internal oscillator; and more on-chip data memory than the Atmel AT89C51RD2/ED2 (4KB vs. 2KB EEPROM and 2048 vs. 1792 bytes ERAM).

Some standard features on the AT89LP51RD2/ED2/ID2 are enhanced with new modes or operations. Mode 0 of Timer 0 or Timer 1 acts as a variable 9–16 bit timer/counter and Mode 1 acts as a 16-bit auto-reload timer/counter. In addition, each timer/counter may independently drive an 8-bit precision pulse width modulation output. Mode 0 (synchronous mode) of the serial port allows flexibility in the phase/polarity relationship between clock and data.

The I/O ports of the AT89LP51RD2/ED2/ID2 can be independently configured in one of four operating modes. In quasi-bidirectional mode, the ports operate as in the classic 8051. In input-only mode, the ports are tristated. Push-pull output mode provides full CMOS drivers and open-drain mode provides just a pull-down. Unlike other 8051s, this allows Port 0 to operate with on-chip pull-ups if desired.

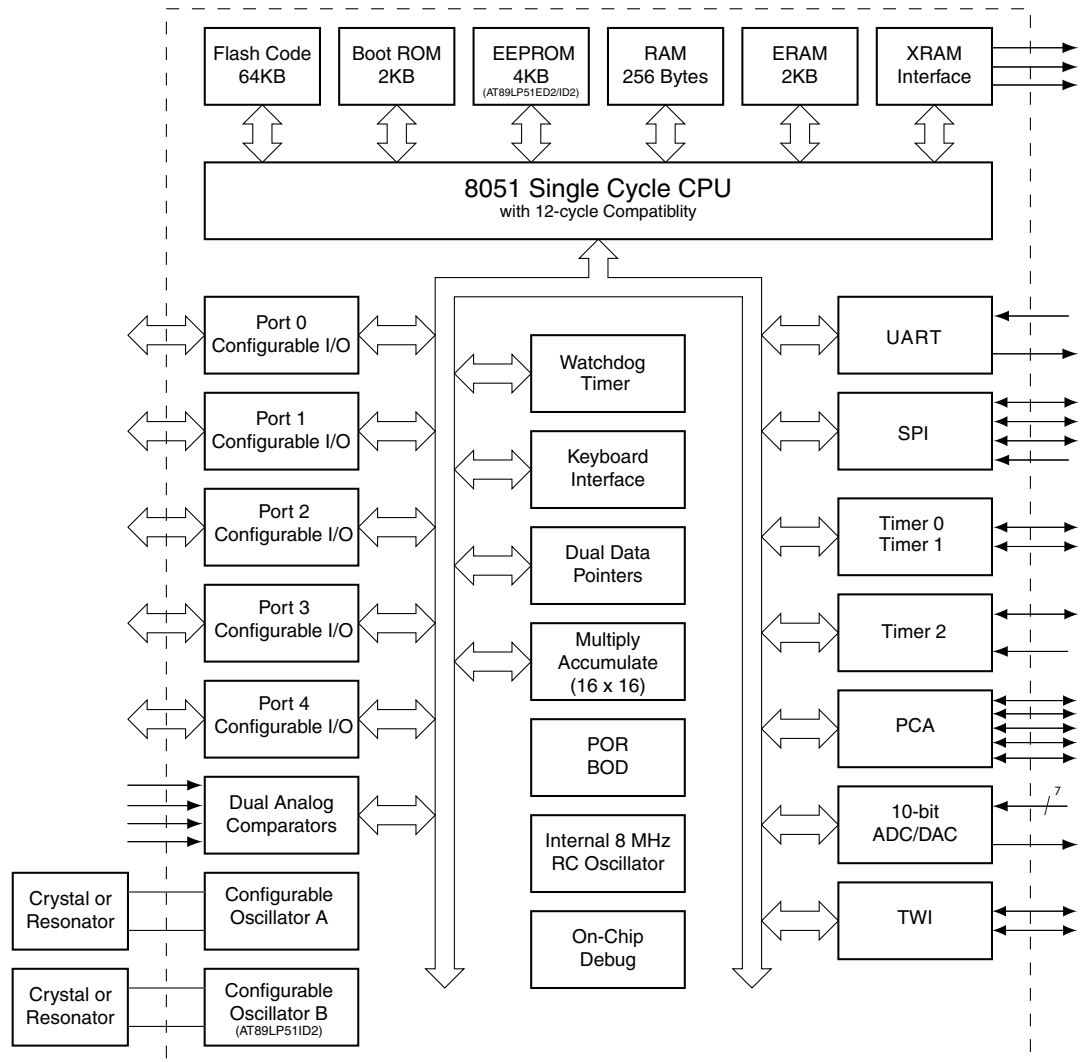

The AT89LP51RD2/ED2/ID2 includes an On-Chip Debug (OCD) interface that allows read-modify-write capabilities of the system state and program flow control, and programming of the internal memories. The on-chip Flash and EEPROM may also be programmed through the UART-based bootloader or the SPI-based In-System programming interface (ISP).

The TWI and OCD features are not available on the PDIP package. The AT89LP51ID2 is also not available in PDIP.

The features of the AT89LP51RD2/ED2/ID2 make it a powerful choice for applications that need pulse width modulation, high speed I/O, and counting capabilities such as alarms, motor control, corded phones, and smart card readers.

2.1 Block Diagram

Figure 2-1. Atmel AT89LP51RD2/ED2/ID2 Block Diagram

2.2 System Configuration

The AT89LP51RD2/ED2/ID2 supports several system configuration options. Nonvolatile options are set through user fuses that must be programmed through the flash programming interface. Volatile options are controlled by software through individual bits of special function registers (SFRs). The AT89LP51RD2/ED2/ID2 must be properly configured before correct operation can occur.

2.2.1 Fuse Options

Table 2-1 lists the fusible options for the AT89LP51RD2/ED2/ID2. These options maintain their state even when the device is powered off. Some may be changed through the Flash API but others can only be changed with an external device programmer. For more information, see the datasheet.

Table 2-1. User Configuration Fuses

Fuse Name	Description
Clock Source A	Selects between the High Speed Crystal Oscillator, Low Power Crystal Oscillator, External Clock on XTAL1A or Internal RC Oscillator for the source of the system clock when oscillator A is selected.
Clock Source B	Selects between the 32 kHz Crystal Oscillator, External Clock on XTAL1B or Internal RC Oscillator for the source of the system clock when oscillator B is selected (AT89LP51ID2 Only).
Oscillator Select	Selects whether oscillator A or B is enabled to boot the device. (AT89LP51ID2 Only)
X2 Mode	Selects the default state of whether the clock source is divided by two (X1) or not (X2) to generate the system clock.
Start-up Time	Selects time-out delay for the POR/BOD/PWD wake-up period.
Compatibility Mode	Configures the CPU in 12-clock compatibility or single-cycle fast execution mode.
XRAM Configuration	Configures if access to on-chip memories that are mapped to the external data memory address space is enabled/disabled by default.
Bootloader Jump Bit	Enables or disables the on-ship bootloader.
On-Chip Debug Enable	Enables or disables On-Chip Debug. OCD must be enabled prior to using an in-circuit debugger with the device.
In-System Programming Enable	Enables or disables In-System Programming.
User Signature Programming Enable	Enables or disables programming of User Signature array.
Default Port State	Configures the default port state as input-only mode (tristated) or quasi-bidirectional mode (weakly pulled high).
Low Power Mode	Enables or disables power reduction features for lower system frequencies.

2.2.2 Software Options

Table 2-2 lists some important software configuration bits that affect operation at the system level. These can be changed by the application software but are set to their default values upon any reset. Most peripherals also have multiple configuration bits that are not listed here.

Table 2-2. Important Software Configuration Bits

Bit(s)	SFR Location	Description
PxM0.y PxM1.y	P0M0, P0M1, P1M0, P1M1, P2M0, P2M1, P3M0, P3M1, P4M0, P4M1	Configures the I/O mode of Port x Pin y to be one of input-only, quasi-bidirectional, push-pull output or open-drain. The default state is controlled by the Default Port State fuse above
CKRL	CKRL	Selects the division ratio between the oscillator and the system clock
TPS ₃₋₀	CLKREG.7-4	Selects the division ratio between the system clock and the timers
ALES	AUXR.0	Enables/disables toggling of ALE
EXRAM	AUXR.1	Enables/disables access to on-chip memories that are mapped to the external data memory address space
WS ₁₋₀	AUXR.6-5	Selects the number of wait states when accessing external data memory
XSTK	AUXR1.4	Configures the hardware stack to be in RAM or extra RAM
EEE	EECON.1	Enables/disables access to the on-chip EEPROM
ENBOOT	AUXR1.5	Enables/disables access to the on-chip Flash API

2.3 Comparison to the Atmel AT89C51RD2/ED2/ID2

The Atmel® AT89LP51RD2/ED2/ID2 is part of a family of devices with enhanced features that are fully binary compatible with the 8051 instruction set. The AT89LP51RD2/ED2/ID2 has two modes of operations, Compatibility mode and Fast mode. In Compatibility mode the instruction timing, peripheral behavior, SFR addresses, bit assignments and pin functions are identical to the existing Atmel AT89C51RD2/ED2/ID2 product. Additional enhancements are transparent to the user and can be used if desired. Fast mode allows greater performance, but with some differences in behavior. The major enhancements from the AT89C51RD2/ED2/ID2 are outlined in the following paragraphs and may be useful to users migrating to the AT89LP51RD2/ED2/ID2 from older devices. A summary of the differences between Compatibility and Fast modes is given in [Table 2-3 on page 11](#). See also the Application note “Migrating from AT89C51RD2/ED2/ID2 to AT89LP51RD2/ED2/ID2.”

2.3.1 Instruction Execution

In Compatibility mode the Atmel® AT89LP51RD2/ED2/ID2 CPU uses the six-state machine cycle of the standard 8051 where instruction bytes are fetched every three system clock cycles. Execution times in this mode are identical to the Atmel AT89C51RD2/ED2/ID2. For greater performance the user can enable Fast mode by disabling the Compatibility fuse. In Fast mode the CPU fetches one code byte from memory every clock cycle instead of every three clock cycles. This greatly increases the throughput of the CPU. Each standard instruction executes in only one to four clock cycles. See datasheet for more details. Any software delay loops or instruction-based timing operations may need to be retuned to achieve the desired results in Fast mode.

2.3.2 System Clock

The system clock source is not limited to a crystal or external clock. The system clock source is selectable between the crystal oscillator, an externally driven clock and an internal 8.0MHz RC oscillator for AT89LP51RD2/ED2 and clock source A of AT89LP51ID2. Clock source B of AT89LP51ID2 is not limited to a 32 kHz crystal. The clock source B is selectable between the 32 kHz crystal oscillator, an externally driven clock and an internal 8.0MHz RC oscillator. Unlike AT89C51ID2, the X2 and CKRL features will also affect the OSCB source.

By default in Compatibility mode the system clock frequency is divided by 2 from the externally supplied XTAL1 frequency for compatibility with standard 8051s (12 clocks per machine cycle). The System Clock Divider can scale the system clock versus the oscillator source. The divide-by-2 can be disabled to operate in X2 mode (6 clocks per machine cycle) or the clock may be further divided to reduce the operating frequency. In Fast mode the clock divider defaults to divide by 1.

2.3.3 Reset

The RST pin of the AT89LP51RD2/ED2/ID2 has selectable polarity using the POL pin (formerly \overline{EA}). When POL is high the RST pin is active high with a pull-down resistor and when POL is low the RST pin is active low with a pull-up resistor. For existing AT89C51RD2/ED2/ID2 sockets where \overline{EA} is tied to VDD, replacing AT89C51RD2/ED2 with AT89LP51RD2/ED2/ID2 will maintain the active high reset. Note that forcing external execution by tying \overline{EA} low is not supported.

The AT89LP51RD2/ED2/ID2 includes an on-chip Power-On Reset and Brown-out Detector circuit that ensures that the device is reset from system power up. In most cases a RC startup circuit is not required on the RST pin, reducing system cost, and the RST pin may be left unconnected if a board-level reset is not present.

2.3.4 Timer/Counters

A common prescaler is available to divide the time base for Timer 0, Timer 1, Timer 2 and the WDT. The TPS_{3-0} bits in the CLKREG SFR control the prescaler. In Compatibility mode TPS_{3-0} defaults to 0101B, which causes the timers to count once every machine cycle. The counting rate can be adjusted linearly from the system clock rate to 1/16 of the system clock rate by changing TPS_{3-0} . In Fast mode TPS_{3-0} defaults to 0000B, or the system clock rate. TPS does not affect Timer 2 in Clock Out or Baud Generator modes.

In Compatibility mode the sampling of the external Timer/Counter pins: T0, T1, T2 and T2EX; and the external interrupt pins, $\overline{INT0}$ and $\overline{INT1}$, is also controlled by the prescaler. In Fast mode these pins are always sampled at the system clock rate.

Both Timer 0 and Timer 1 can toggle their respective counter pins, T0 and T1, when they overflow by setting the output enable bits in TCONB.

2.3.5 Interrupt Handling

Fast mode allows for faster interrupt response due to the shorter instruction execution times.

2.3.6 Keyboard Interface

The AT89LP51RD2/ED2/ID2 does not clear the keyboard flag register (KBF) after a read. Each bit must be cleared in software. This allows the interrupt to be generate once per flag when multiple flags are set, if desired. To mimic the old behavior the service routine must clear the whole register.

The keyboard can also support general edge-triggered interrupts with the addition of the KBMOD register.

2.3.7 Serial Port

The timer prescaler increases the range of achievable baud rates when using Timer 1 to generate the baud rate in UART Modes 1 or 3, including an increase in the maximum baud rate available in Compatibility mode. Additional features include automatic address recognition and framing error detection.

The shift register mode (Mode 0) has been enhanced with more control of the polarity, phase and frequency of the clock and full-duplex operation. This allows emulation of master serial peripheral (SPI) and two-wire (TWI) interfaces.

2.3.8 I/O Ports

The P0, P1, P2 and P3 I/O ports of the AT89LP51RD2/ED2/ID2 may be configured in four different modes. The default setting depends on the Tristate-Port User Fuse. When the fuse is set all the I/O ports revert to input-only (tristated) mode at power-up or reset. When the fuse is not active, ports P1, P2 and P3 start in quasi-bidirectional mode and P0 starts in open-drain mode. P4 always operates in quasi-bidirectional mode. P0 can be configured to have internal pull-ups by placing it in quasi-bidirectional or output modes. This can reduce system cost by removing the need for external pull-ups on Port 0.

The P4.4–P4.7 pins are additional I/Os that replace the normally dedicated ALE, PSEN, XTAL1 and XTAL2 pins of the AT89C51RD2/ED2/ID2. These pins can be used as additional I/Os depending on the configuration of the clock and external memory.

AT89LP51RD2/ED2/ID2 Summary - Preliminary

2.3.9 Security

The AT89LP51RD2/ED2/ID2 does not support the external access pin (\overline{EA}). Therefore it is not possible to execute from external program memory in address range 0000H–1FFFH. When the third Lockbit is enabled (Lock Mode 4) external program execution is disabled for all addresses above 1FFFH. This differs from AT89C51RD2/ED2/ID2 where Lock Mode 4 prevents \overline{EA} from being sampled low, but may still allow external execution at addresses outside the 8K internal space.

2.3.10 Programming

The AT89LP51RD2/ED2/ID2 supports a richer command set for In-System Programming (ISP). Existing AT89C51RD2/ED2 programmers should be able to program the AT89LP51RD2/ED2/ID2 in byte mode. In page mode the AT89LP51RD2/ED2/ID2 only supports programming of a half-page of 64 bytes and therefore requires an extra address byte as compared to AT89C51RD2/ED2. Furthermore the device signature is located at addresses 0000H, 0001H and 0003H instead of 0000H, 0100H and 0200H.

Table 2-3. Compatibility Mode versus Fast Mode Summary

Feature	Compatibility	Fast
Instruction Fetch in System Clocks	3	1
Instruction Execution Time in System Clocks	6, 12, 18 or 24	1, 2, 3, 4 or 5
Default System Clock Divisor	2	1
Default Timer Prescaler Divisor	6	1
Pin Sampling Rate ($\overline{INT0}$, $\overline{INT1}$, T0, T1, T2, T2EX)	Prescaler Rate	System Clock
Minimum RST input pulse in System Clocks	12	2

3. Special Function Registers

A map of the on-chip memory area called the Special Function Register (SFR) space is shown in [Table 3-1](#).

Note that not all of the addresses are occupied, and unoccupied addresses may not be implemented on the chip. Read accesses to these addresses will in general return random data, and write accesses will have an indeterminate effect. User software should not write to these unlisted locations, since they may be used in future products to invoke new features.

5. Packaging Information

5.1 44AA – VQFP/LQFP

COMMON DIMENSIONS
(Unit of Measure = mm)

SYMBOL	MIN	NOM	MAX	NOTE
A	–	–	1.60	
A1	0.05	–	0.15	
A2	0.95	1.40	1.05	
D	11.9	12.00	12.10	
D1	9.90	10.00	10.10	Note 2
E	11.9	12.00	12.10	
E1	9.90	10.00	10.10	Note 2
B	0.30	–	0.45	
C	0.09	–	0.20	
L	0.45	–	0.75	
e	0.80 TYP			

Notes:

1. This package conforms to JEDEC reference MS-026, Variation ACB.
2. Dimensions D1 and E1 do not include mold protrusion. Allowable protrusion is 0.25 mm per side. Dimensions D1 and E1 are maximum plastic body size dimensions including mold mismatch.
3. Lead coplanarity is 0.102 mm maximum.
